

Process & Decision Documentation

Project/Assignment Decisions

Focus on: I focused on creating an interactive soccer game using simple UI and visuals. I focus on how to create different screens in different files and how to make sure the game runs smoothly when changing the code in each file.

Entry Header

Name: Vrajani Popawala

Role(s): Editor

Primary responsibility for this work: Editing and refining the game code. Improving the game flow, interaction, understanding how different screens work on different files, and working on the overall user experience.

Goal of Work Session: The goal of this work session was to create a visual storytelling game. To improve the old code into a game with better obstacles, visuals, and responsiveness. I created an interactive soccer game.

GenAI Documentation

GenAI was used

Date Used: February 2nd, 2026

Tool Disclosure: ChatGPT 5.2

Purpose of Use: The purpose was to help build code for an interactive soccer game. It helped with debugging the code when I ran into issues and clarified specific codes in the game.

Summary of Interaction: GenAI was used to review some of the code, identify problems, and suggest on how to fix code structure. It also gave suggestions to improve the game and create better UX design.

Human Decision Point(s): I reviewed all the suggestions and decided which suggestions aligned with my vision for the game. I chose what the game is supposed to be about and how the user would interact with the game.

Integrity & Verification Note: All prompts were made by me. The GenAI was reviewed by me and lots of iteration was made by me. I rejected ideas that did not align with my vision for the soccer game. The game was tested to make sure it ran smoothly. I checked the sidequest outline to make sure I was creating the right game type.

Scope of GenAI Use: GenAI was used as a tool to create the soccer game. GenAI was used to fix the code when it wasn't. As well as to explain some of the code and to see if the code structure was correct.

Limitations or Misfires: Some of the suggestions given didn't help when I ran into problems. I had prompted GenAI multiple times to fix my code. For example when creating the soccer field the white lines, at first it wouldn't go across the screen so I had to ask what code is making the line and prompt it multiple times to fix the issue.

Summary of Process (Human + Tool): I gave GenAI the prompts for the soccer game. I asked GenAI to explain why the code wasn't working and to explain some of the code structure. After reviewing some of the suggestions, I used the ones that would work best with my game. I tested each code given to make sure the game actually works.

Decision Points & Trade-offs: I decided to keep the game simple because I had to iterate a lot, so I believe if made more complex it would take too much time. I focus on creating fun simple games with a smooth user experience.

Verification & Judgement: I verified that all code given by testing it to make sure it was following the prompt I gave. I made sure the interactive parts like the arrow keys worked smoothly and each part in the game functioned right.

Limitations, Dead Ends, or Open Questions: Some limitations were that the game was basic due to GenAI not fixing or understanding the code right away. It took a lot of iteration to get this game this simple so I was afraid if I kept asking for more the code would break.
